

United State Core Data for Interoperability v5 Recommendations **THIA Policy & Standards Working Group**

The Texas Health Informatics Alliance (THIA) mission is to collaborate on improving health informatics and health care, and meet Texas' current and future health informatics needs. We build informatics ties across Texas by bringing together researchers, developers, health professionals, information management professionals, data and information scientists, students, and anyone interested in health informatics to collaborate, communicate, and network in Research, Data, Education/Workforce Development, and Policy and Standards.

Provenance

Author, Author Role

The Texas Health Informatics Alliance (THIA) Policy and Standards Working Group support including legal author and author role to provide important information for better clinical decision-making. We recommend a national definition for legal author as various states may have different definitions. This is especially critical for institutions that provide clinical services between/across states or provide care to patients from other states.
