

We, Net Health, share the principle that to achieve an open, connected care for our communities, we all have the responsibility to take action. To further these goals, we commit to the following principles to advance interoperability among health information systems enabling free movement of data, which are foundational to the success of delivery system reform.

- **Consumer Access:** To help consumers easily and securely access their electronic health information, direct it to any desired location, learn how their information can be shared and used, and be assured that this information will be effectively and safely used to benefit their health and that of their community.
- **No Blocking/Transparency:** To help providers share individuals' health information for care with other providers and their patients whenever permitted by law, and not block electronic health information (defined as knowingly and unreasonably interfering with information sharing).
- **Standards:** Implement federally recognized, national interoperability standards, policies, guidance, and practices for electronic health information, and adopt best practices including those related to privacy and security.

As creators of specialized healthcare software tailored to facilitate efficient workflow and seamless exchange of health-related information between providers, interoperability has always been paramount to our business. We recognize that specialized care providers have unique data they need to capture that is integral to their industry, but at the same time can take advantage of information that may already exist in other systems such as patient demographic and appointment scheduling information.

Integration with hospital-wide Electronic Medical Records (EMRs), Healthcare Information Exchanges (HIEs), and various other technology partners results in improved documentation efficiency and allows providers more time to spend with their patients. Interoperability can also enable additional functional capabilities, such as electronically prescribing controlled substances or reporting immunizations to registries, resulting in a comprehensive and robust business solution.

Focusing on patients, Net Health has also spent significant efforts developing patient portals that allow easy access to and ability to securely share their charts with other providers to advance continuity of care.

We ensure a safe, reliable and HIPAA compliant exchange of patient data using industry standards. Our software has imported 2.2 million patients, sent over 3.3 million charges, and transmitted over 3 million clinical documentation records.

We support and implement integration according to HL7, CCD, CCDA, and direct messaging standards. Looking towards the future, we are developing standards-based technology that will serve as a foundation for Fast Healthcare Interoperability Resources (FHIR) integration.

Net Health recognizes the vast importance of interoperability and with this pledge commits to a continued prioritization of the secure and efficient exchange of health data.
